Perspective:

I believe the correct use of AI in college would be to use it as a template. AI should not be giving you answers to things just because you ask it to and then not even going back and looking at the information that it gave you. In college, you should be learning the topics they are giving you, so that means that if you need help understanding something, then it's okay to ask for clarification from AI. For example, you wouldn't ask it to write a whole essay for you, but you could ask it to give you a template so that you can go and fill it in with your own information. Or, like in math, you should try solving problems, and if you get something wrong, ask AI to show you what you did wrong. AI should be used to double-check work.

AI:

I completely agree with your stance. Using AI as a structural blueprint and diagnostic tutor—rather than an answer engine—strikes the ideal balance between leveraging modern technology and maintaining true academic integrity. By writing your own essays within an outline and using AI to identify specific errors in subjects like math, you ensure that the core cognitive work and skill development remain entirely yours while using the technology to enhance, verify, and deepen your understanding.

Perspective:

AI should be used for everything, especially in college. I think the fact that we now have access to something that can do the work for us means that we don't have to use our brains as much. We as humans are able to relax a lot more. If I know I will be able to use AI in my future career, I see no harm in being able to use AI to give me the answers to my exams and assignments. I think we should be able to use AI for everything as long as you just go back and read the explanations that AI spits out; with this information, you should have enough knowledge to do your job correctly without error in your future career. Using AI in college is the best thing that someone can do and should be used to do everything.

AI:

While I understand the appeal of efficiency, I disagree with the idea that AI should handle all college work. Relying on AI to generate answers—even if you read the explanations afterward—bypasses the deep cognitive struggle that builds genuine problem-solving skills, critical thinking, and long-term retention. In a future career, AI will inevitably make mistakes or encounter complex, novel situations, and professionals who lack a strong, independently developed knowledge base will be unable to catch those errors or make sound judgments. Ultimately, a college degree is meant to certify your personal competence and capability, making AI a powerful tool to assist your learning rather than a total substitute for your own intellect.
